INCREMENTAL ENCODER GENERAL DESCRIPTION

Working principle

An encoder is a rotational transducer converting an angular movement into a series of electrical digital pulses. If associated to racks or endless screws, these generated pulses can be used to control angular or linear movements. During rotation, electrical signals can be elaborated by numerical controls (CNC), programmable logic controls (PLC), control systems, etc. Main applications of these transducers are: machinery, robots, motor feedback, measure and control devices. In Eltra's encoders the angular movement transduction is based on the photoelectric scanning principle. The reading system is based on the rotation of the radial graduated disk formed by opaque windows and transparent ones alternated. The system is perpendicularly illuminated by an infrared light source. The light projects the disk image on the receivers surface which are covered by a grating called collimator having the same disk steps. The receivers transduce the light variation occurring with the disk shifting, converting them into their corresponding electrical variations. Electrical signals raised to generate squared pulses without any interference must be electronically processed. The reading system is always carried out in differential modality, in order to compare different signals nearly identical but out of phase for 180 electrical degrees. That in order to increase quality and stability of output signals. The reading is designed comparing the difference between the two channels eliminating the disturb note as "shifted common way" because signals are overlapped in equal way on every kind of wave.

Incremental encoders

The incremental encoder usually gives two types of squared waves out of phase for 90 electrical degrees. They are usually called channel A and B. The first channel gives information about the rotation speed while the second, basing on the states sequence produced by the two signals, provides the sense of rotation. A further signals, called Z or zero channel, is also available. It gives the absolute zero position of the encoder shaft. This signal is a squared impulse with the phase and the width centred on A channel.

The incremental encoder precision depends on mechanical and electrical factors. These errors could be: grating division, disk eccentricity, bearings eccentricity, electronic reading and optic inaccuracy. The measurement unit to define encoder precision is the electrical degree. It determinates the division of the impulse generated by the encoder: 360 electric degrees correspond to the mechanical rotation of the shaft which is necessary to carry out a complete cycle. To know how many mechanical degrees correspond to electrical 360° the following formula has to be applied:

$$\text{Electrical } 360^\circ = \frac{\text{Mechanic } 360^\circ}{n^\circ \text{ pulse / turn}}$$

The encoder division error is given from the maximum shifting shown in the electrical degrees of two consecutive surges. This error exists in any encoder and is due to the above mentioned factors. For Eltra's encoders this error is included in electrical +/- 25° Max in whatever allowed condition, which corresponds to a shifting of +/- 7 % from the nominal value. Regarding the 90 electrical degrees shifting between the two channels, it differs by +/- 35 electrical degrees Max. It corresponds to +/- 10 %.

Graphic representation of the A, B and Z incremental signals.

Incremental encoder with integrated commutation phases

In addition to the above mentioned encoders, there are others which integrate additional electrical output signals. These are the incremental encoders with integrated commutation signals, used as motor feedback. These additional signals simulate the Hall phases generally present in the commutation motors (brushless type) and usually designed with magnetic sensors. In Eltra's encoders these commutation signals are optically generated and presented as three squared waves, shifted by 120° electrical degrees. These signals will be used by the driver control to the motor in order to generate the correct voltages phase to determinate the correct rotation. These commutation pulses can be repeated many times within one mechanical rotation because they directly depend on the poles number in the connected motor. So we have commutation phases for motors of 4, 6 or more poles.

Graphic representation of A, B and Z incremental signals with commutation U, V and W.

EL30 E/H/I INCREMENTAL ENCODER

Incremental encoder

Miniaturized Ø30 encoder series. Used when a minimal size is required even providing excellent performances.

- Up to 1024 ppr with Zero.
- Several output types available. Up to 24 Vdc input voltage.
- Up to 100 kHz frequency response
- Output cable. Cable connector available on request.
- Several flanges available
- Up to 3.000 rpm speed rotation
- Up to IP54 sealing

EF 36 K INCREMENTAL ENCODER + INCREMENTAL PHASES

Incremental encoders for motor feedback

Ø36 encoder series used in feedback systems on AC servomotor. It integrates a traditional incremental encoder and the optical generation of "Hall effect phases".

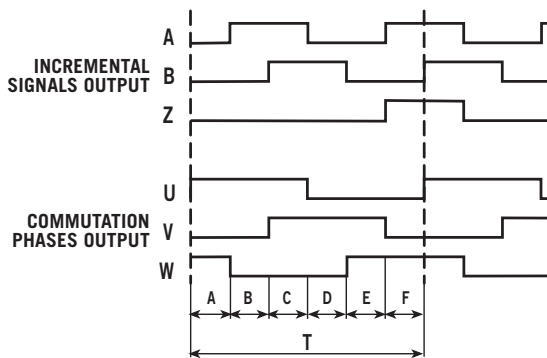

Main characteristics are:

- Interchangeability with 15 size resolver that allow to save time and money because it is sufficient to have only one predisposition for the retromotor.
- Easy mechanical assembly
- Contained dimensions
- Wide resolution range available

EL 38 G

EL 38 F

EL 38 G

HOW TO MOUNT IT

- 1) Couple the encoder shaft with the motor shaft
- 2) Fix the spring at the motor flanges without screwing it
- 3) Fix the encoder shaft by the metal ring
- 4) Block the spring

HOW TO MOUNT IT

- 1) Mount the antirotation pin on the motor flange.
- 2) Couple the encoder shaft with the motor shaft, ensuring that the pin is inserted on the cave on the frontal part of the encoder (maintaining a minimum distance of 0,5 mm)
- 3) Fix the encoder shaft by the metal ring

Electrical specifications

Resolution	from 1 to 2000 PPR
Input voltage	5 \pm 28 Vdc LINE DRIVER available only with input voltage 5 / 8-24 Vdc

EL/EF/EW48C-P INCREMENTAL ENCODER + COMMUTATION PHASES

Encoder series EL/EF/EW48 C-P

Ø48 encoder series used in feedback systems on AC servomotor. They integrate a traditional incremental encoder with the optic generation of "Hall effect phases".
Main characteristics are::

- Easy mechanical assembly
- Contained dimensions
- Wide resolution range available
- High temperature resistance

EL series

Basic version with incremental outputs
Several output types available

EF series

Optic engendering of the "commutation phases" integrated to the basic version
Signals transmission by parallel connection

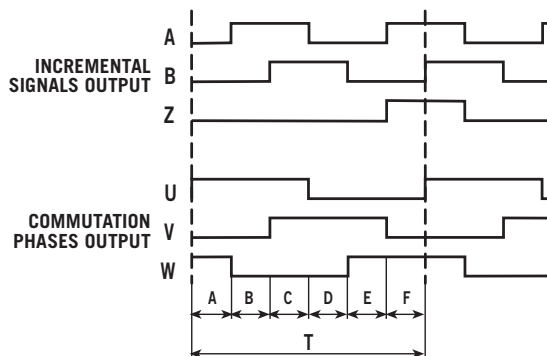

EW series

Special version of the EF series featuring a wiring simplification, obtained through the sequential transmission of the incremental and commutation phases as shown on the below graph.

- Phase 1** HIGH "HZ" IMPEDANCE PHASE
- Phase 2** TRANSMISSION COMMUTATION PHASES
- Phase 3** INCREMENTAL OUTPUT SIGNAL TRANSMISSION

Signal configuration

POLES	A/B/C/D/E/F	T
4	30° ± 1.5°	180°
6	20° ± 1.5°	120°
8	15° ± 1.5°	90°

Electrical specifications

Resolution from 1 to 2048 PPR

Source and sink current 15 mA for channel with LINE DRIVER
30 mA for channel with other electronics

Frequency response 150 KHz Max
 $F = \frac{\text{RPM} \times \text{Resolution}}{60}$

EL series electrical specifications

Input voltage 5Vdc / 8÷24 Vdc

Output type NPN / NPN OPEN COLLECTOR / PUSH PULL / LINE DRIVER

Input current with no output load 100 mA Max

EF/EW series electrical specifications

Input voltage 5Vdc ± 5%

Output types for incremental phases LINE DRIVER

Output types for Hall phases LINE DRIVER / NPN OPEN COLLECTOR

Input current with no output load 150 mA Max

EH-EL58F/G EH-EL63F/G/FB/GB

Blind hollow shaft encoder

EH-EL 58 F/G

EH-EL 63 F/G

EL 63 FB

EL 63 GB

HOW TO MOUNT THE EH-EL63F

- 1) Couple the encoder shaft with the motor shaft
- 2) Fix the spring at the motor flanges without screwing it
- 3) Fix the encoder shaft by the metal gear.
- 4) Block the spring

HOW TO MOUNT THE EH-EL63G

- 1) Mount the antirotation pin on the motor flange.
- 2) Couple the encoder shaft with the motor shaft, ensuring that the pin is inserted on the cave on the encoder front part (maintaining a minimum distance of 0,5 mm)
- 3) Fix the encoder shaft by the metal ring

EH-EL63P/PB/PBF/PC/PCF

Through hollow shaft encoder

EL 63 PB / PBF

EL 63 P

EL 63 PC

EL 63 PCF

EH-EL58-63
EH-EL63P/PB/PBF/PC/PCF

HOW TO MOUNT THE EH-EL63P

- 1) Mount the antirotation pin on the motor flange.
- 2) Couple the encoder shaft with the motor shaft, ensuring that the pin is inserted on the cave on the encoder front part (maintaining a minimum distance of 0,5 mm)
- 3) Fix encoder packed shaft with the motor shaft. Insert the washer at the extremity of the encoder shaft.

Electrical specifications series EL

Resolution	from 1 to 10000 PPR for EL58-63F/G from 1 to 2048 PPR for EL63P/PB/GB/FB/PC/PBF/PCF
Input voltage	5 ÷ 28 Vdc LINE DRIVER only available with input voltage 5/8 ÷ 24 Vdc
Input current with no output load	100 mA Max
Source and sink current	50 mA for channel 20 mA for channel with LINE DRIVER
Output types	NPN / NPNOPEN COLLECTOR/ PUSH PULL / LINE DRIVER
Frequency response	300 KHz Max $F = \frac{\text{RPM} \times \text{Resolution}}{60}$

Electrical specifications series EH

Resolution	from 40 to 1024 PPR for EH58-63F/G
Input voltage	5Vdc / 8 ÷ 24 Vdc LINE DRIVER only available with input voltage 5/8 ÷ 24 Vdc
Input current with no output load	100 mA Max
Source and sink current	50 mA for channel 20 mA for channel with LINE DRIVER
Output types	NPN / NPNOPEN COLLECTOR/ PUSH PULL / LINE DRIVER
Frequency response	100 KHz Max $F = \frac{\text{RPM} \times \text{Resolution}}{60}$

Mechanical specifications

Bore diameter	ø6-ø9,52(only mod.58)-ø10-ø12-ø14-ø15 mm H7
Enclosure rating	IP54 standard IP66 optional (only EH-EL58-63F/G)
Shaft speed	3000 RPM
Shock	50 G for 11 msec (with plastic disc) 20 G for 11 msec (with glass disc)
Vibrations	10G 10 ÷ 2000 Hz
Bearings life	10 ⁹ revolutions
Bearings	n° 2 ball bearings
Shaft material	Stainless steel AISI303
Body material	Aluminium UNI 5076
Housing material	PA 66 reinforced with fiber glass

EH/EF 80C/P/K INCREMENTAL ENCODER

Motor's line Incremental encoders

Ø80 encoder series used to feedback systems on AC servomotor. They integrate a traditional incremental encoder and the optic generation of "Hall effect phases". Main characteristics are:

- Contained dimensions
- Wide resolution range available
- High temperature resistance
- Easy mounting

EH series

Basic version with incremental outputs
Several output types available

EF series

Optic engendering of the " commutation phases" integrated to the basic version
Signals transmission by parallel connection

Electrical specifications

Resolution	from 200 to 2048 not electronically multiplied
Source and sink current	15 mA for channel with LINE DRIVER 15 mA for channel with other electronics
Frequency response	300 KHz Max $F = \frac{RPM \times Resolution}{60}$

EH series electrical specifications

Input voltage	5 / 8 ÷ 24 Vdc
Output types	NPN / NPNOPEN COLLECTOR/ PUSH PULL / LINE DRIVER
Input current with no output load	100 mA Max

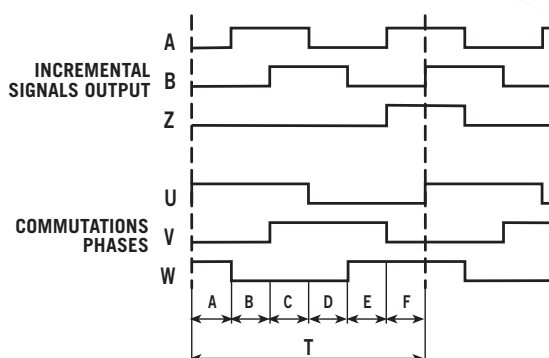

EF series electrical specifications

Input voltage	5 Vdc ± 5%
Output types for incremental phases	LINE DRIVER
Output types for Hall phases	NPN / NPNOPEN COLLECTOR/ PUSH PULL / LINE DRIVER
Input current with no output load	200 mA Max

Mechanical specifications

Through hole diameter EH / EF 80P (mm)	ø8 / ø10 / ø14 / 15 mm H7
Blind hole diameter EH / EF 80C (mm)	ø8FG6 / ø10G6 ø14 / ø15
Enclosure rating	IP54 standard
Shaft speed	3000 RPM
Vibrations	10G 10 ÷ 2000 Hz
Bearings life	10 ⁹ revolutions
Bearings	n° 2 ball bearings
Shaft material	Aluminium
Housing material	PA 66 reinforced with fiber glass
Operating temperature	-10° ÷ +85°C
Storage temperature	-25° ÷ +85°C
Weight	250 g

Signal configuration

POLES	A/B/C/D/E	T
4	30° ± 1.5°	180°

EL88P INCREMENTAL ENCODER

Incremental encoder

- Ø88 encoder series with through hollow shaft used on motors.
- Up to 38mm hole diameter
- Easy and safe fixing
- Sturdy mechanics
- Up to 2.048 ppr with Zero
- Several output types available.
- Up to 28 Vdc input voltage.
- Up to 100 kHz frequency response
- Up to 3.000 rpm speed rotation
- Up to IP54 sealing

EC34 ENCODER FOR RACKS

Encoder for racks

Rack encoders with automatic slack recovery. If compared to an incremental linear system, this type of encoder extremely simplifies linear measurements and overcomes measurement problems on long distance. Our models are sealed in a robust aluminium body and integrate a preload system allowing the automatic slack recovery between rack and pinion.

- Up to 2.000 ppr with zero
- Several output types available.
Up to 24 Vdc input voltage.
- Up to 300 kHz frequency response
- Output cable with connector.

RH200A/B/C RH-RM500A/B/C METRIC WHEELS

Metric wheels

Eltra's metric wheels series is studied for specific industrial application where is required to measure a linear movement (i.e. continuous sheet cutting machines of wood, textiles, glass, etc.). Precise reading and high stress resistance are the main features of those encoders. The body is entirely designed of aluminium and mounted using an oscillating arm pivoted on the axial. It comes with an integrated self-lubricating compact box to assure a long operation period without any maintenance. The weighty metric wheel keeps a stable contact with the material, allowing an accurate measurement of both length and speed. The wheel surface can be in crossed-knurl aluminium, special anti-oil or anti-slide rubber.

FE ROPE ENCODER

Incremental encoder

Rope extension encoder series available for lengths up to 8 mt. and resolutions up to 0,01 mm. The mounted encoder could be incremental or absolute, both available with SSI or PROFIBUS interface.

Perfectly suitable also for critical environments, considering the high mechanical resistance characteristics.

SPECIAL PRODUCTS

Ordering code

The encoder to be used in the FE model needs to be ordered separately. The "F" letter will be placed before the standard ordering code.

Example:

- 1- encoder model EH30M ordering code: FEH30M300S8/24P6X6PR
- 2- encoder model EL53B ordering code: FEL53B1100S5/28P6X3MR
- 3- encoder model EAM53B ordering code: FEAM53B16/4096G8/28PPX6X3MER

Complete ordering code example:

FE2000A-FEH30M300S8/24P6X6PR

EBM

Tape composition

As shown below, the Eltra magnetic tape is composed by three layers:

- 1 - A flexible magnetic tape made of plastic material
- 2 - A magnetised steel tape used to create a shield against any external magnetic disturb. Although, it's glued to the upper plastic layer in order to supply the correct mechanical consistency to the magnetic tape.
- 3 - The third part is the most rigid one and therefore is supplied separately due to transport and application needs. It must be stick to layer 1 by the user. The steel tape is magnetically neutral and employed to mechanically protect the magnetic tape.

NOTE: To prevent damage from possible internal tensions in the magnetic tape, keep the tape rolled up with the magnetic part facing outwards with a minimum internal diameter of 300 mm.

Installation measures of the magnetic tape

Fixing pressure

The magnetic tape is adhesive. Therefore, it is important an optimum contact between surfaces for a correct application. A good pressure must be uniformly applied to guarantee a perfect result.

Gluing temperature

In order to guarantee an optimum adhesion it is preferable a surface temperature between 20° and 37° C. Maximum adhesion is obtained after 72 hours at a temperature of 21° C. We suggest to avoid applying the magnetic tape at a lower than 10° C surface temperature.

Application materials

For a correct adhesion the magnetic tape must be placed in dry, smooth and clean places. The surface must be cleaned with an alcohol-water solution at 50% or heptane. For appliances on brass, copper etc. the surface must be protected to prevent possible oxidation.

Chemical agents and magnetic tape behaviour

The EMD board

This board is used when is necessary to carry out a selected signal among a maximum of three inputs

The EMD board accepts as input signals coming from a maximum of three encoders and supplies as output the signals electronically selected of one of these.

The output signal is selected by opportunely supplying the two inputs, IN1 and IN2, according to the working diagram (see back side).

Output and encoder type to be connected have to be within the range described in the ordering code. All electronic types of the connected encoders have to be the same. Moreover, the EMD supplies three contacts normally open switching to close when the respective input is selected.

In order to better understand the use of this board the following example is provided.

We would like to realize a device reading three encoders input (or other sensors with compatible characteristics), in a sequential way. Encoders have to be chosen featuring the same electronics output, for example 5 Vdc line-driver. Instead, the device can acquire data with another electronic type; for example 24 Vdc push-pull.

In this case the EMD board realizes the commutation function of the connected encoders and adapts the electronics of those with the one required from the instrument.

The ordering code will be:

EMD5L8/249

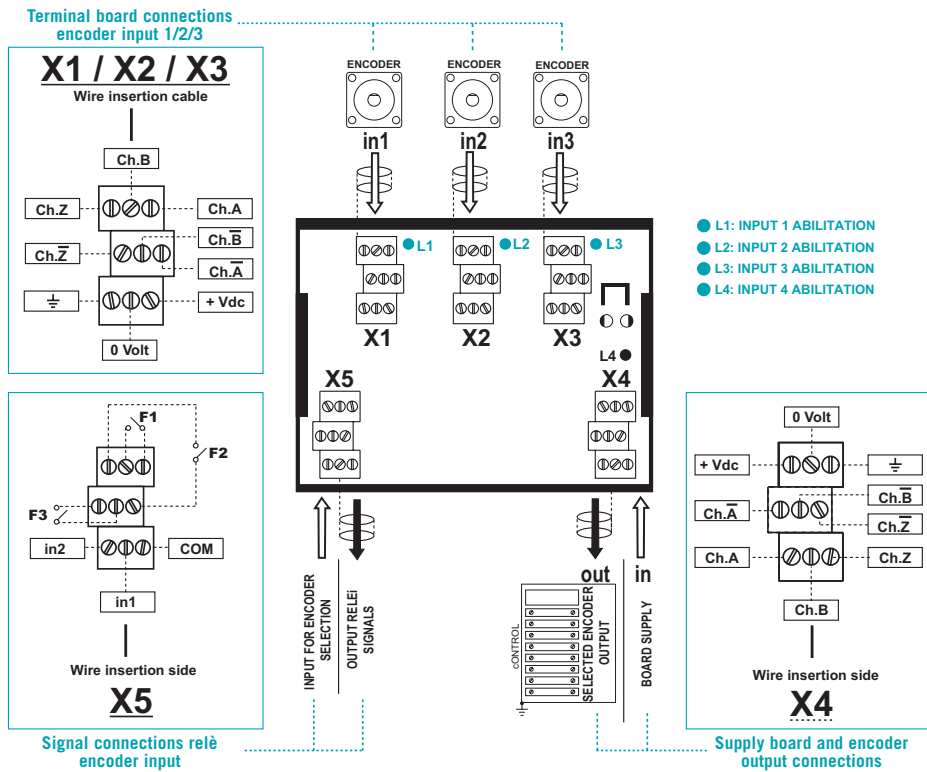

5L indicates that inputs are 5 Vdc line-driver. **8/24P** indicates that the output is with push-pull electronics and with an input voltage from 8 to 24 Vdc. The board input voltage has to be the highest between the requested: in this case 8/24 Vdc. The encoder commutation happens through a logic type signal at the IN1 and IN2 inputs on the Xn terminal board.

The logic level "1" is obtained by connecting the above mentioned inputs to a voltage included between +5 and +24 Vdc.

Instead, for the "0" level, the voltage must be between 0 and +3 Vdc. The combination of the logic levels at IN1 and IN2 configures the terminal board of output in 4 different mode as described in the table in the following page.

Overall dimension

Working diagram and terminal connections board

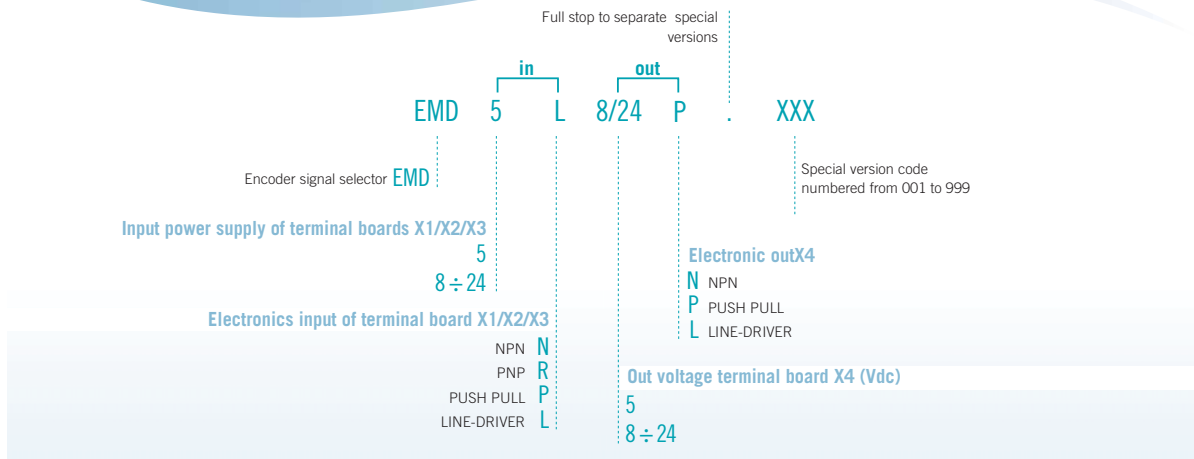

Logic status table

The table indicates the output status on the X4 connector and on the free contacts on X5, according to the logics status present on in1 and in2 on the X5 terminal board.

Logic status on X5		Encoder selected on X4			Contact selected on X5

Ordering code

PRECISION ELASTIC COUPLINGS

Elastic Couplings

Ordering Code

ELTRA elastic precision couplings are essential parts for the transmission of rotational motion to the encoder shaft. Couplings are designed in aluminium alloy (type D11S A.A 2011) and are composed by a cylindrical body on which there is an helicoidal groove.

Main characteristics are:

- torsional rigidity
- ability to support slight shaft misadjustments
- ability to absorb small axial shift of the shaft.

ELTRA elastic couplings have also a perfect balancing of the rotating body. They don't have critical points subjects to breakage and are completely frictionless. Moreover, they perfectly transmit the rotation motion, even in case of axial misadjustment and misalignment. Our coupling do not require any type of maintenance. The internal drain allows the coupling between the shafts from a minimum of 0.5mm to a maximum of 6.12mm (note "F" quota).

NOTE: Elastic Coupling can be supplied with different coupling diameters. Eg: d1=8mm, d2=10mm. In this case the identification code should be: G25A8/10.

NOTE FOR THE INSTALLER: For a proper installation is suggested to insert shaft on the coupling respecting quotes

Eltra also produces a special coupling series designed especially for critic and heavy uses. On the table below are shown some special couplings available on stock. Different couplings available only on request.

OUTPUT CONFIGURATIONS AND CONNECTIONS

NPN and NPN OPEN COLLECTOR electronic

It is composed only by an NPN transistor and a pull-up resistor used to match the output voltage to the power supply when the transistor is quiescent. From the electrical point of view it is similar to TTL type logic and so it is considered compatible. If used correctly, it shows low saturation levels at 0 Vdc and close to 0 at the positive. It is proportionally influenced by the cable length, pulses frequency and by the load.

Please consider these specs for a proper use. The open collector variant is different for the lack of the pull-up resistor, freeing in such way the transistor collector from the tie of the encoder power supply allowing to obtain signals with different voltage.

NPN OPEN COLLECTOR

NPN

PNP OPEN COLLECTOR

PNP

PNP and PNP OPEN COLLECTOR electronic

Main characteristics and limitations are the same as for NPN electronics. Main difference is the transistor, which is of PNP type and is constrained to the positive. The resistor, if present, is a pull-down one. Therefore, it is connected between the output and zero Vdc.

PUSH-PULL

PUSH-PULL electronic

Electronic featuring high performances. NPN or PNP major limitations are caused by the resistor, which works with a much higher impedance than a transistor. To overcome this issue, push-pull electronic uses a complementary transistor, so the impedance is lower for commutation to positive and to zero. This solution increases frequency performances allowing longer cable connections and an optimal data transmission even at high working speed. Saturation signals are low but sometimes higher than in NPN and PNP electronics. Anyway, PUSH-PULL electronics is in any case indifferently applicable instead of NPN or PNP.

LINE DRIVER

LINE DRIVER electronic

LINE DRIVER is used when operating environments are particularly exposed to electrical disturbances or when the encoder is quite far from the receiver system. Data transmission and receiving work on two complementary channels so disturbances are limited (they usually come from other cables or close machinery). These interferences are known as «common way disturbances» as their generation is due to a common point: the system mass. Instead, in LINE-DRIVER transmitted and received signals work in «differential» way. In other words, it works basing the communication on voltage differences between complementary channels. Therefore it is not effective to common way disturbances. This type of transmission is used in 5 Vdc systems and it is also known as RS422 compatible. It is available with power supplies up to 24 Vdc

PROTECTIONS

Protection for output stages

Two different kind of electronic protection against short circuits might be used: the passive one (using fuses, no linear resistors, etc.) and active one (using transistors). Eltra's encoders can be equipped with both type of protection against short circuits

Passive protection

Passive solution is the cheapest one. It is used to avoid accidental short circuits, which rarely happens. The component which carries out the protection is called PTC. It is a resistor that, if crossed by a voltage exceeding the supposed one, increases its resistance to limit electricity exceedance. Limitations of this kind of protection concern the low reacting speed, which may progressively stress the components under protection. Therefore, this protection is effective against a limited number of short circuits and it is available only for NPN, PNP, and PUSH-PULL electronics.

Active protection

This solution is based on a circuit integrated in the electronic output which constantly controls the temperature reached by the element to be protected. In this way, protection is very effective and the reacting speed very high. Moreover, it ensures a constant protection against repetitive and permanent short circuits, that is why is strongly suggested for heavy usages. It is available only for LINE-DRIVER and PUSH-PULL electronics.

LINE DRIVER without ZERO

LINE DRIVER with ZERO

PRECAUTIONS AGAINST ELECTROSTATIC DICHARGES

Be sure the metallic connector is connected to the ground through a ring fixed to the screw of the connector itself (Fig. 1)

Fig. 1

Ground connect to the shield and the connector case (Fig. 2)

Fig. 2

For a better protection of the electronics against electrostatic discharges connect the metallic connector case to ground

Cable proper use

- Ensure a ground connection to the cable shield avoiding to connect it to the power ground.
- Keep the encoder cable (signal cable) to a proper distance from the power ones.
- Choose the cable's length according to installation requirements.
- Spread the cable avoiding spirals.

News

- Cable extensions and connectors could be designed on demand
- Testing on 100% of the production
- Antivibration wiring system

INCREMENTAL ENCODER CONNECTIONS

INSTALLATION AND OPERATION PRECAUTIONS

The encoder must be used with respect to its specifications. Encoder is a pulse generator and not a safety device

Assembling and installing personnel must be qualified and carefully follow instructions of technical manual.

Don't expose the device to stress or impacts in order to ensure the correct working otherwise the warranty expires

Make sure that the mechanical coupling of the encoder shaft is designed with the appropriate elastic couplings, especially in the case of accentuated axial or radial movements

Make sure that the environment of use is free of corrosive agents (acids, etc.) or substances that are not compatible with the device

Check the ground connection of the device if it is not possible to provide additional external connection.

Before putting it in operation, verify the voltage range applicable to the device and protect it from exceeding the stated technical specifications.

Connect power supply and signals cables in order to avoid capacitive or inductive interferences that may cause malfunction of the device.

Cable wiring must be carried out in a POWER-OFF condition

For safety reasons, we strongly recommend to avoid any mechanical or electrical modification. In that case, they will void the warranty

Main product warranty terms

Replacements or repairs whether under the warranty or at the customer's expense must be performed in the service department of Eltra Srl or by explicitly authorized personnel. Before sending material for repairing, you must obtain an RGA number from our sales office. During the repair process in our service department, Eltra srl will be authorized to remove all parts that the customer added to the product. Any malfunction due to a failure to observe these usage and installation precautions will lead to the warranty voiding. Repairs will not extend the product warranty. We also exclude compensation for any type of damage or injury due to the use, or suspension of use, of the transducer.

Note: for additional information, refer to the sale terms on our website, www.eltra.it, or call our office.
